Abstract

This report provides an analysis of 85 AI tools across a range of domains, such as writing and content creation, meetings, presentations, voice and video generation, design and image creation, automation, memory and information retrieval, scheduling assistance, website building, search engines, coding assistance, and legal advice. It examines the impact of Generative Artificial Intelligence (GenAI) technologies on content production and automation, detailing how GenAI solutions have transformed the business landscape by introducing new methods for content creation and processing. Additionally, the report showcases the application of GenAI in its own development process, utilizing the ChatGPT custom instruction function for the creation of all tool reviews.

The document places particular emphasis on the transformation process, highlighting the effective use of GenAI tools in content recompilation and reformulation through ChatGPT, which ensures both accuracy and the use of natural language. It also addresses the challenges and limitations encountered during the transformation process, such as the inclusion of unintended sections and the exclusion of required ones, underlining the practical challenges of applying GenAI in content transformation.

This report is designed to assist business professionals and others in exploring, evaluating, and leveraging AI tools to enhance business operations and stimulate innovation.

Chapter 1

Introduction

Applications based on the use of artificial intelligence and the extensive models created for it, such as language and image models, have made tremendous progress in the last couple of years. Applications that were previously developed for narrow field specialization purposes, mainly based on machine learning (ML) and its classification skills, have been joined by new generative artificial intelligence (GenAI) technology.

GenAI technology solutions developed by large companies, such as OpenAI, Google, and IBM, have significantly changed the business landscape. Applications based on GenAI offer new ways of producing and processing content. With the advent of large language models (LLMs), AI-powered user interfaces have become available to ordinary users, which has, in turn, increased interest in the use of artificial intelligence.

The Report is Aimed at the Business Community in Satakunta

This report introduces a wide range of AI tools available on the market to the business community in Satakunta. The report is part of the Modernization of technology companies using artificial intelligence and robotics project [76] and involves trials of content and collaboration offerings in modernization services. The report represents the 'showcase' section of content development for modernization services. Through it, business representatives can independently explore the content available through the service and develop their own ideas for future collaboration.

The report is also an example of how GenAI, using large language models, can be utilized in content production and how work instructions given to AI applications can be used for automation and thereby for the repeatability of content production.

Structure of the Report

This document is divided into three chapters. The first chapter (Chapter 1) explains the motivation for making this report and also describes how the process of making this document, and how AI was utilized in this process. Chapter 2 contains the reviews for the 85 AI tools, with information on the tools’ use cases, business models and limitations. The content in Chapter 2 has been generated with AI. Finally, the Chapter 3 summarized this work and highlights some general findings (and challenges on the use of AI) faced when making this document. The chapter concludes with a section discussing possible future directions and ideas of improvement for those planning for creating similar reports in the future.
1.1 Background

This report utilizes AI tool mapping work compiled earlier (in 2023). The original material’s content has been recompiled and reformulated using ChatGPT and its large language model’s ability to understand verbal instructions from users and articulate content in natural language.

The presentation of each AI tool in the report is done through sections describing the tool’s features. The original mapping material contained more/extensive sections or other content, which was technically oriented (targeted more towards developers).

In this report, the presentation, selection, and order of tools are designed to be suitable for business representatives exploring the topic. The presentation is based on a standardized number of sections, where numbers or technical terms describing features are articulated into sentences.

The need and specifications for the articulation process were produced through ChatGPT’s Custom Instruction [52] feature (Appendix B), and the actual ’writing’ was done through sessions conducted in ChatGPT. Each tool was treated in its own session, aiming for the AI to produce content as automatically as possible without user guidance or additional instructions.

The AI ”work instructions” developed for content transformation process (AI tool’s review and AI tool group’s overview) are described in Appendix B.

1.1.1 Original Material Content

Experiment for AI driven Transformation Process requires suitable content material. That material we have acquired via collaboration with author of original AI tool mapping document[29].

In original content layout has been designed on base where author has compared different individual tool reviews available (for example in databases, articles and magazines and social media platforms) and also using author’s personal viewpoints. Tools in original mapping document were selected more from review process point of view, that due to their quality or been factually best in the market. As author has mentioned, original goal was to gather tools for business, but there are content which could be better for individual artists.

In this document, we do not evaluate original selection process, categorizing nor the created review content.

1.1.2 Transformation Process

Our goal was to study if original mapping document content could be transformed such a way that readers from business community without the need of knowledge about AI tools could have increased their interest towards AI tools.

For the presentation of each individual tool, we have aimed to create a standardized structure, which would be used throughout this report. The final structure for each tool review consists of six sections. This structuring differs from the eight-section format used in the original mapping document[29], and the differences are illustrated through the figure 1.1.

The sections listed on the left (figure 1.1) are from the original document and the section on the right are the ones used in this report. The descriptions of the sections on the left contain reasoning on why the sections were chosen in the original report. The descriptions on the right describe when and why the sections are present in this report.

The sections and their purpose (as they are presented in this report) can be briefly described as follows:

- **Description** serves as an initial decision-making point for the reader to continue with the review. It provides a concise overview of the tool, highlighting its main features and potential applications.

- **Use Cases** are designed to help the reader determine the suitability of the tool for their specific needs. If a use case can be identified from the original review content, it is included here to facilitate the decision-making process.

- **Business Models** compile information about the different plans available for the tool. This section also notes whether paying additional fees can enhance the tool’s capabilities to a better level.

- **Getting Started** simplifies the information regarding the steps required to activate the tool for the first time. It aims to provide firsthand experience and set expectations for the tool.

- **Limitations** focuses solely on the actual limitations of the tool, which could become a major obstacle for the reader’s usage.

- **User Reviews** seeks to compile evaluations given to the tool by user testimonials or due to score averages from developer communities. This section aims to provide a broader perspective on the tool’s effectiveness and user satisfaction.

1.1.3 Deviations in the Transformation Process

During process it was noted that AI had included also original sections into content. This was due ”AI’s opinion”, against wanted section structure form. On the other hand there were some cases where required section was not
Figure 1.1: Renewed section structure.

AI was instructed to avoid exact costs values as their information is most likely out of date by the time this report is published. Against given guidelines some cost information occurs in content and this is mentioned (in footnotes). The AI generated text may also mix several currencies (e.g. Euros and U.S. dollars) within the same section or sentence, so the reader should very careful in reading the contents, and it is recommended to ignore the monetary values listed in text.

Occasionally the section names have minor variation, e.g., Business Model vs. Business Models. This is caused by the AI text generation process. These issues have not been fixed in the document, as they do not affect the overall content of the document, but the reader can judge the AI’s work quality by studying these minor issues. The more major issues (or exceptions from the given AI instructions) have been specifically marked in the document (as footnotes).

Examples of the footnotes for unwanted sections\(^1\) generated by the AI against the given instructions, footnotes for missing sections\(^2\)\(^3\)\(^4\)\(^5\)\(^6\)\(^7\), and an example of a footnote for monetary values\(^8\) to be ignored by the reader are listed in the bottom of this page. These footnotes are generally marked in the titles of the sections. In a few cases, the footnote marker can be found inside a section text, in cases where AI has produced an extra, unwanted section, which does not have a title. These footnotes are identical throughout the document, so the reader can also find these issues from the

AI Tool Reviews

This chapter explores a range of AI tools and their applications across different areas. It starts with AI tools in Writing and (text) Content Creation Assistants, which help in creating text for individuals and teams. The chapter then moves on to Meetings, discussing tools that automate recording and summarizing to improve online meetings.

In Presentations, the chapter reviews AI tools that help users create slideshows. It also covers Voice and Video Generation, showing how AI can create audio and video content from text. The discussion includes Design and Image Creation, where AI assists in making visuals and designs.

Furthermore, this chapter touches on Automation tools that simplify tasks, and Memory and Information Retrieval systems that manage information effectively. Scheduling Assistants are mentioned for managing appointments, while Website Builders are highlighted for creating websites without coding knowledge.

Additionally, this chapter includes Search Engines with enhanced search features, Coding Assistants for software development support, and Legal Advice tools for automated legal help.

Notes to the reader

The reviews included in this section are based on a previous mapping document[29], and the transformation process has been performed with an automated AI language model. This process has been briefly explained in Subsection 1.1.2. The compilers of the report have not checked the details of the content related to individual tool presentations. Additionally, some of the information in the original material (such as service costs) may be outdated or changed. If interested, the reader should check the current status of the tool in question. Reference to the tool has been added in beginning of Description section next to tool’s name and it is seen in form of [number]. This works as a link into tool’s information in References chapter and there is URL for tool’s web page.

Limitations

Writesonic’s reliance on GPT-3.5 in its free and lowest-tier unlimited plan might be seen as a limitation. The credit system can be a drawback as credits are consumed even if the generated content is not satisfactory. Not all of the 25+ languages offered are available in every feature. Some users have reported issues with plagiarism, writing errors, and factual inaccuracies in larger copy outputs.

Its free plan and affordable paid options make it accessible for testing different features. The chatbot’s internet access, voice command capability, and selection of pre-built personalities add to its appeal. However, the image creation feature may not be as impressive compared to specialized tools. The interface is well-designed, intuitive, and visually appealing, contributing to an overall positive user experience.

The presence of a free version allows potential users to test the platform’s capabilities without any initial investment, ensuring a risk-free trial.

Limitations

Despite its comprehensive offerings, Simplified has its limitations. The chatbot, while versatile, lacks internet access and may not outperform specialized solutions like ChatGPT. The platform’s content generation is not uniformly excellent across all topics, with occasional inaccuracies or irrelevant suggestions. Furthermore, while it supports 20+ languages, some, like Finnish, are not available. Another point of contention is the platform’s array of tools; while diverse, they may not match the quality of dedicated, standalone tools for writing, image and video creation, and presentations.

User Reviews

Users have positively rated Simplified, with scores of 4.7/5 on G2.com and 4.4/5 on Producthunt, reflecting satisfaction with the platform’s all-in-one approach.

User Experience (UX)

The initial experience on Simplified can be somewhat overwhelming, with a screen brimming with various tools and features. However, the platform mitigates this complexity through comprehensive tutorial videos and helpful hints. The interface, despite some unconventional element placements, is visually appealing. Users can then explore the platform through the website or the iOS app. The app allows users to upload videos or directly record using the app. It supports organizing work into sessions, scenes, and takes, with editing capabilities for a streamlined workflow.

Limitations
Despite its innovative approach, Move.AI has certain limitations. Currently, it’s only available as an iOS app, and the footage requirements are quite specific, demanding HD quality (1920x1080) at 60 FPS, and at least 2 camera sources. Additionally, the subscription fees are on the higher end, and some users might find a steep learning curve with certain advanced features.

User Reviews
As of now, there are not enough reviews available to provide a comprehensive understanding of user sentiment towards Move.AI. However, this section can be expanded as more feedback becomes available.

Key Offerings
Move.AI stands out for its ability to create lifelike 3D models and avatars, providing quality motion capture at a significantly lower cost compared to traditional methods. User Experience (UX)
The user interface of Move.AI, while not the most aesthetically pleasing, is praised for its ease of use. However, some advanced features, such as motion capture models and mappings, present a learning curve and could benefit from additional guidance or tutorials. The requirement for specific hardware to capture footage (HD 60 FPS devices) may limit the ability to fully test and utilize the platform’s capabilities.

While Move.AI introduces an innovative approach to motion capture, making it accessible and cost-effective, it’s important for potential users to consider the specific requirements and current limitations of the platform. As the technology and user base grow, it’s expected that Move.AI will evolve, potentially expanding its accessibility and enhancing user experience.

The free version offers up to three videos, with a choice of five actors and availability in 50 languages. It includes ten video templates and allows for basic customization like colors, images, and logos but results in watermarked videos. On the other hand, the premium plans, priced at $29.99 per month or $199 per year, extend the offerings to 5-40 videos per month with more actors, commercial usage, an increased number of templates, access to stock images, no watermark, and enhanced customization and analytics.

Commercial usage is restricted to paid subscriptions. The time to create a video, ranging from 15 to 60 minutes, might be a constraint for users needing quicker results. Additionally, the realistic presenters’ lip-syncing is not always accurate, and editing, which also costs credits, may be seen as a limitation.

User Reviews

As of now, there are not enough user reviews available to provide a comprehensive understanding of Oxolo’s reception in the market.

User Experience (UX)

From a user experience perspective, Oxolo is easy and straightforward to use. The process of generating a video is simple: users just need to submit a URL. However, the quality of the free version’s output, particularly in terms of the presenter’s mouth movements and voice synchronization, might not meet all expectations, and could potentially be improved in the paid subscriptions. The user interface is aesthetically pleasing and intuitive, but the editing capabilities in the free version are limited, which might restrict the full exploration of the tool’s functionalities.

Additionally, the learning curve for achieving better-quality images and the tool’s limitation to 20 different materials highlight areas where users may face challenges. Despite these drawbacks, Canvas remains a highly valuable tool for creative exploration.

User Reviews

Due to the limited availability of user reviews, a comprehensive assessment of NVIDIA Canvas’s market reception is challenging. However, the key offerings such as its exceptional quality as a free product, the ability to speed up concept exploration, and its revolutionary approach to digital art creation suggest a positive user experience. Feedback on the user experience (UX) indicates that Canvas is easy to use for beginners, though achieving more realistic images and mastering all features may require some practice.

Functioning seamlessly with Microsoft Edge, Bing Chat has positioned itself as a formidable alternative to Google, particularly with the integration of the innovative ChatGPT feature. This integration not only enhances the user experience but also broadens the utility spectrum, making it an attractive option for both individual and corporate users seeking a multifaceted digital assistant.

Business Model

Bing Chat operates under a freemium model, ensuring accessibility for a wide user base. This approach allows users to experience the core functionalities without any initial financial commitment, aligning with the needs of businesses that are cautious about upfront investments in digital tools.

Getting Started

Engaging with Bing Chat is notably straightforward. Users can initiate interactions without the need for registration, offering an immediate and hassle-free start. However, for extended usage beyond five prompts per session, linking personal and work Microsoft accounts becomes necessary. This not only enhances the user experience by personalizing interactions but also integrates seamlessly with the user’s digital ecosystem, given the prevalence of Microsoft products in the business domain.

Features (with Microsoft Account)

Bing Chat is powered by the advanced GPT-4, ensuring a robust and dynamic interaction capacity. Users can engage in up to 30 chats per session, with a generous daily limit of 300 interactions. The platform’s versatility is further underscored by features like a choice between creative, balanced, or precise conversation modes, a substantial 2000-character limit per prompt, and an integrated image creator powered by DALL-E. Additionally, functionalities such as visual search, voice input, follow-up question suggestions, and the provision of supplementary learning resources and information sources significantly enhance the utility for business users.

Limitations

Despite its robust offerings, Bing Chat does have limitations. It is perceived to be slower in generating responses compared to alternatives like ChatGPT Plus, and the chat limit per session may hinder prolonged interactions. The requirement to use Microsoft Edge could also be seen as a limitation for users who prefer other browsers.

Key Offerings

Bing Chat’s key offerings include free access to advanced AI technologies like GPT-4 and DALL-E (with certain usage restrictions), the ability to tailor the conversation mode according to the user’s preference, and a commitment to transparency and learning by providing sources and further reading links. The ability to create charts and export conversations further enhances its appeal to the business sector, especially for those involved in data analysis and reporting.

User Reviews

With an impressive rating of 4.4 out of 5 on G2.com, Bing Chat has garnered positive feedback from its user base. This rating reflects the platform’s commitment to delivering a high-quality user experience and its success in meeting the diverse needs of its users.

User Experience (UX)

The user interface of Bing Chat is lauded for its aesthetic appeal and simplicity, making it accessible for users of varying technological proficiency. However, there is room for improvement. Users have expressed a desire for more immersive visual experiences, such as viewing generated images in full screen within the same window, and a more intuitive accessibility to settings, possibly through a more conspicuous design of the menu options.

Chapter 3

Conclusions

In this final chapter, the experiences and insights gained from the work of creating this report are discussed. In addition to comments on exploring and evaluating the tools, this chapter lists some minor and more major issues faced in using ChatGPT for transforming an existing source material (technical notes) into a more verbal descriptive textual content. Finally, the last section gives a brief summary of the contents of this reports and highlights some limitations and possible future direction for those planning on creating similar reports either with or without AI assistance.
3.1 AI tools for business

This report presented a total of 85 AI tools. The largest groups included applications specialized in meetings and appointments, as well as those for producing images or videos. The tool presented in the legal category is not unique; rather, the original document’s compilation was cut short due to time constraints. In terms of actual grouping, there are certainly other alternative models available online. From the user’s perspective, the grouping is secondary information, as only the actual tool and its utilization methods matter.

For the business world, new AI applications are both a threat and an opportunity. They pose a threat because, even if an organization does not use them, a potential competitor might. The potential of AI tools to increase productivity can quickly change the competitive landscape, presenting an opportunity that an organization can aim to leverage.

3.1.1 Exploring the Tools

The marketing of digital services does not necessarily require offering a freemium model, allowing potential customers to explore the tool, but it seems to be the de facto approach with the AI tools. Practically, it’s advisable to explore a specific tool deliberately, setting aside time for it and starting the exploration at an optimal point in the week. If it’s possible to move between freemium and other levels on, for example, a monthly basis, the tool’s new dimensions can be tested periodically.

3.1.2 User Evaluations and Experiences

As with other digital tools, it’s important to consider the feedback from other users and the activity of the tool’s development work in AI tools. The evaluations, whether good or bad, given by thousands of other users provide a strong foundation for what to expect from the tool.

3.1.3 Investing in Tools

New applications are emerging in a rapid pace, leading to potentially short lifespans for individual applications. A strong and active development team behind a tool is a good starting point for investment. Monthly payments made by credit card, even if just a few tens of dollars, can quickly accumulate into a significant sum. Therefore, maintaining some form of expense or inventory table is advisable. As with exploration, it’s also beneficial in actual use to navigate between the tool’s business models and only use paid levels when the utility can be effectively utilized. It might also be challenging to estimate future usage costs for a particular application.
3.2 Final Thoughts on the Transformation Process

The transformation of technical descriptions or notes into a more verbal format using the AI’s language model is astonishingly fast when compared to the amount of hours it takes for a human to produce similar results. Furthermore, the AI produces clear text from source material without noticeable language errors, though the choice of words (particularly adjectives) can be noticeably different than those chosen by humans. Depending on the use case this may or may not be an issue. In any case, when successful, this process significantly reduces the time it takes to produce new text.

Unfortunately, based on the experiences, ChatGPT does not yet offer a reliable fool-proof level of trust for automatic content production and requires human user assistance and evaluation. As can be seen in this document, the content is generally of good quality, but it can be very challenging to define the prompts so that the output always follow the desired template or instruction set. Whether these minor deviations are critical depends on the use case.

3.2.1 Transformation Quality

While the instructions given to ChatGPT and the results obtained seemed quite functional on an individual test basis, deviations were not uncommon. This can be seen by the reader when browsing through the tool presentations. In many cases, the AI included additional sections from the original material that were not requested. The process also often "forgot" the instruction to use sentence form and resorted to producing listings, requiring several regenerations of the results until text in the required format was produced.

User actions or guidance were avoided as a primary option, so regenerating the result was the default action. The outcomes of this action varied greatly. Sometimes, the desired outcome was quickly achieved, while at other times, it could not be obtained. In a few cases, user feedback was tried, and in those instances, the AI made adjustments according to the original instruction. Interestingly, it was often enough to simply ask the AI to "recreate the text, use the instructions provided", without actually providing any new instructions. However, this did not align with the goal of creating automation.

The AI was also asked to provide a self-analysis of reasons why it did not follow the given instructions. This allowed the created content to be compared with the instructions in the CI, and the AI was asked for observations on possible deficiencies or inconsistencies in the instructions. The AI found some, though from human’s point-of-view these inconsistencies did not always make sense. Still, the analyses reflected the AI's 'opinions' on why it made decisions that deviated from the instructions, and observations of the similar "problems" across several tools provide clear development targets for refining the formatting instructions. An example of self-analysis prompt can be found in Appendix D.

Due to the CI form’s character limit (1500 characters), it is challenging to include extensive instructions. Condensing the instruction text makes the specification work difficult and laborious. Initially, changes to individual wordings and presentation orders can create a bit more space, but the task becomes much more demanding in subsequent rounds. The AI was used at several points to analyze whether the instruction text could be clearer if written differently, ensuring that terminology and sentences produce the desired work instruction in the AI’s analysis. This did not always help.

Regarding repeatability, the content produced can generally be considered satisfactory. The generation of the content proved to be easily repeatable, and quite trivial from the user’s point-of-view. The user simply needed to set the custom instructions to ChatGPT and insert the content to the prompt. There were no need to provide any additional instructions in the prompt itself, simply copy-pasting the source material was enough. The resulting (AI generated) material could then be formatted through LaTeX for inclusion in the report. Examples of source material and custom instructions with LaTeX conversion can be found in Appendix C and Appendix B.

During the testing process, OpenAI released a new Custom GPT feature, expanding the content that can be included in the CI form. This new feature may offer better way to define instructions and could be utilized in future experiments.

3.2.2 Transformation Sessions

By default, each tool presentation was conducted in its own session, ensuring that the AI and its language model would not incorporate descriptions of one tool into another’s output.

During the process, situations were also tested where the same session was used for formatting content for several different tools. In tests conducted for individual tools, no direct errors were observed, but this would require more precise human analysis between the source text and the formatted end text (results). For the reliability of the operation, it was positively impacted by the fact that the source text dealt with only one tool at a time.

When presenting a group of tools, the summary process revealed that if the source material contained partial information from another tool group, the result was invalid stories where tools were confused. This was corrected, and for the presentation of tool groups, source materials were produced as separate contents.
Since reliable information on the technical operation and implementation of ChatGPT’s service is not available, using separate prompt sessions is recommended.

### 3.2.3 Transformation Performance and Costs

Outsourced AI gives the impression of limitless resources, but reality often differs.

The time taken to process individual content varied greatly, depending on how many times the formatting had to be requested again (regeneration). In the best case, producing and updating the content of an individual tool in the target document occurred in a few minutes through seamless cooperation between AI and the human user. In the worst case, processing a tool presentation could require an hour’s work. The work was not timed and documented, so these estimates are based on the user’s own views.

A challenge is the input amount limit in at least ChatGPT’s web interface. For example, the 40 inputs in 3 hours offered by the plus version (as of 2/2024) might seem sufficient, but these resources can be consumed surprisingly quickly, especially if the initial result is off-target. During the process, there was interest in whether running the same prompt in a new session abandoning the existing sessions could yield a better results. Unfortunately, this could not be reliably validated, and the incorrect results seem to appear somewhat randomly regardless of whether regenerating results within the same session (using the ChatGPT’s regenerate function) or opening a new one. Considering the input quota, both approaches work the same way, i.e., the effect on the 40 inputs/3 hours quota is identical.

Similarly, running multiple concurrent sessions (chat prompts/windows) are processed as a single, shared quota, which can make multi-tasking a bit cumbersome. On the other hand, the older GPT-3.5 Turbo is excluded from usage quotas, so it is possible to run some jobs though the older model, or switch to using the older one when the quota on the GPT-4 is reached. And in fact, because of the GPT-4 quota, if a larger amount of prompts is expected, it is recommended to use GPT-3.5 Turbo in all cases where it returns acceptable results to conserve the GPT-4 quota. The GPT-3.5 Turbo is also considerably faster than GPT-4. Alternative approach is to use the OpenAI’s API, when applicable.

API interface use was not tested in the process, but it should allow for a larger number of inputs than the web interface. Each input is billed separately in the interface, potentially achieving a situation where the service can be purchased in the exact amount of available work time and labor.

Using the API might also give more stable availability or performance of the service, though without further tests this cannot be reliably validated. In any case, during the use of the ChatGPT web version, several situations were observed where the service’s performance seemed to run out. This seemed strongly related to geographical differences in workday timing, as performance drops started to become noticeable around 3-5 PM Finnish time, while no significant performance decreases were observed from 8 AM to 3 PM. This could hint at performance degradation when both customers from Europe and North America are using the service at the same time.\(^1\)

---

\(^1\)The time difference between Finland and the continental USA is from six to nine hours. Thus 3 PM in Finland would be 9 AM in New York, with work day overlapping in Europe and USA.
3.3 Summary and Future Ideas

The review conducted provided an insightful snapshot of the AI tools available at the time of evaluation, presenting a broad perspective on the state of AI technologies. Notably, the review illuminated the variance in utility and functionality among the vast array of tools, underscoring the prominence of certain applications in code generation, image creation, and video generation domains. However, this landscape is continually evolving, necessitating periodic re-evaluations to remain current.

One notable omission from the current review was the exploration of music generation tools. As the AI field expands, these tools are gaining prominence and should be considered in future assessments. The inclusion of such tools could provide a more comprehensive understanding of the AI ecosystem and its creative capabilities.

The review also touched upon the trend of large corporations integrating AI tools into their existing platforms, such as Microsoft 365 Copilot and Google Workspace AI. This trend towards integration suggests a shift in how AI tools are accessed and utilized, making them more ubiquitous across commonly used applications. The introduction of Business and Enterprise versions of tools like ChatGPT indicates a move towards addressing privacy concerns, an area of significant importance for corporate users.

The analysis identified a prevalent issue within the AI tool landscape: the saturation of the market with numerous subpar tools. Future evaluations should aim to filter and curate the tool databases more rigorously, ensuring that only genuinely beneficial tools are highlighted. Review platforms like Producthunt and G2.com offer models for improved review mechanisms that could be adopted or adapted for more effective tool evaluations.

In forthcoming reviews, evaluators should consider several factors to enhance the thoroughness and relevance of their assessments. These include the offline capabilities of tools, which are crucial for privacy and accessibility; the availability of dedicated desktop applications, mobile apps, or web-based platforms; and the strength of community support and the tool’s development trajectory. Additionally, the relevance of each tool, the ease with which it can be replaced by alternative solutions, and the potential use cases and customer segments that would benefit from the tool should be assessed. Evaluators should also balance user-friendliness against the complexity of features and performance and compare tools within similar price ranges to evaluate their cost-effectiveness and feature sets. Finally, it is important to investigate how each AI tool handles data, including where the data is stored, what happens to the data within the tool, and the potential for data leakage or misuse.

In conclusion, while the promises of AI tools offer enticing visions of efficiency and innovation, actual performance and utility must be rigorously tested. Future evaluations should aim not only to identify the most effective tools but also to understand their market position, usability, and the unique value they offer to different user segments. This approach will enable a more informed and discerning use of AI technologies across various industries and applications.

**Getting started:**
- Google account needed and verified to be over 18 years old — personal account, not under an administrator
- After these — a very quick start

**Features:**
- Unlimited use: prompts, searches etc.
- Search the internet with the chatbot
- Export conversations/results

**Limitations**
- At the moment (21.7.2023) still restricted to areas, just came to Finland about a week ago
- Limitations in Bard’s memory of the conversation
- Can not create images at the moment
- Does not provide links to the sources of information — provides links to for example shoes if you ask top5 shoes — kind of advertising
- Does not provide follow–up questions
- Sometimes a bit slow answering

**Key offerings:**
- Chatbot with ability of searching with Google
- A bit more cautious than ChatGPT — can be a limitation but also can limit hallucinations
- Good feature is for example asking for product reviews — provides images of the products and links to the manufacturers etc.
- If you provide Google your accurate location, Bard can provide you directions, approximate times etc. like Google Maps
- Multiple draft versions of results, which you can select

**UX:**
- Interface looks OK and is very simple to use
- Can not easily use two different chats in turns
- If you want privacy and turn off the 'Bard actions history', sometimes the page does not work and asks to refresh and this wipes out your conversations, however you can keep it on and delete the history manually if you want
- Bard’s answers seemed a bit generic and too cautious in my opinion — did not answer more complex questions
- It makes mistakes in counting letters etc.
Appendix D

An example of self-analysis prompt given to ChatGPT. The custom instructions used in combination with the prompt are the same as listen in Appendix B. The prompt were given immediately after processing the source material.

Provide separate analyze section (called Analytical Commentary) for review text and point out possible section(s) found from source text, but which were not specified in these instructions.

Provide an 'Instruction Analysis' section. In this section, I would like you to:
   Identify and explain any potential areas of confusion or ambiguity in the original instructions that may have affected the review's content or structure. Suggest clarifications or modifications to the instructions that could improve the accuracy and alignment of future reviews with the intended requirements. Reflect on how each section of the review was interpreted based on the given instructions and highlight any discrepancies or areas for improvement.

With the dates and URL replaced with applicable values. The final reference format has been automatically generated by LaTeX when producing the PDF version of this report. No custom instructions were given to ChatGPT.
